

Website design process

Overview of Figma

Figma is a cloud-based design tool that works on any operating system that runs on every web browser. Everyone can share, open, and edit files without an account. This system allows me to speed up my work and keep the cost of my design low.

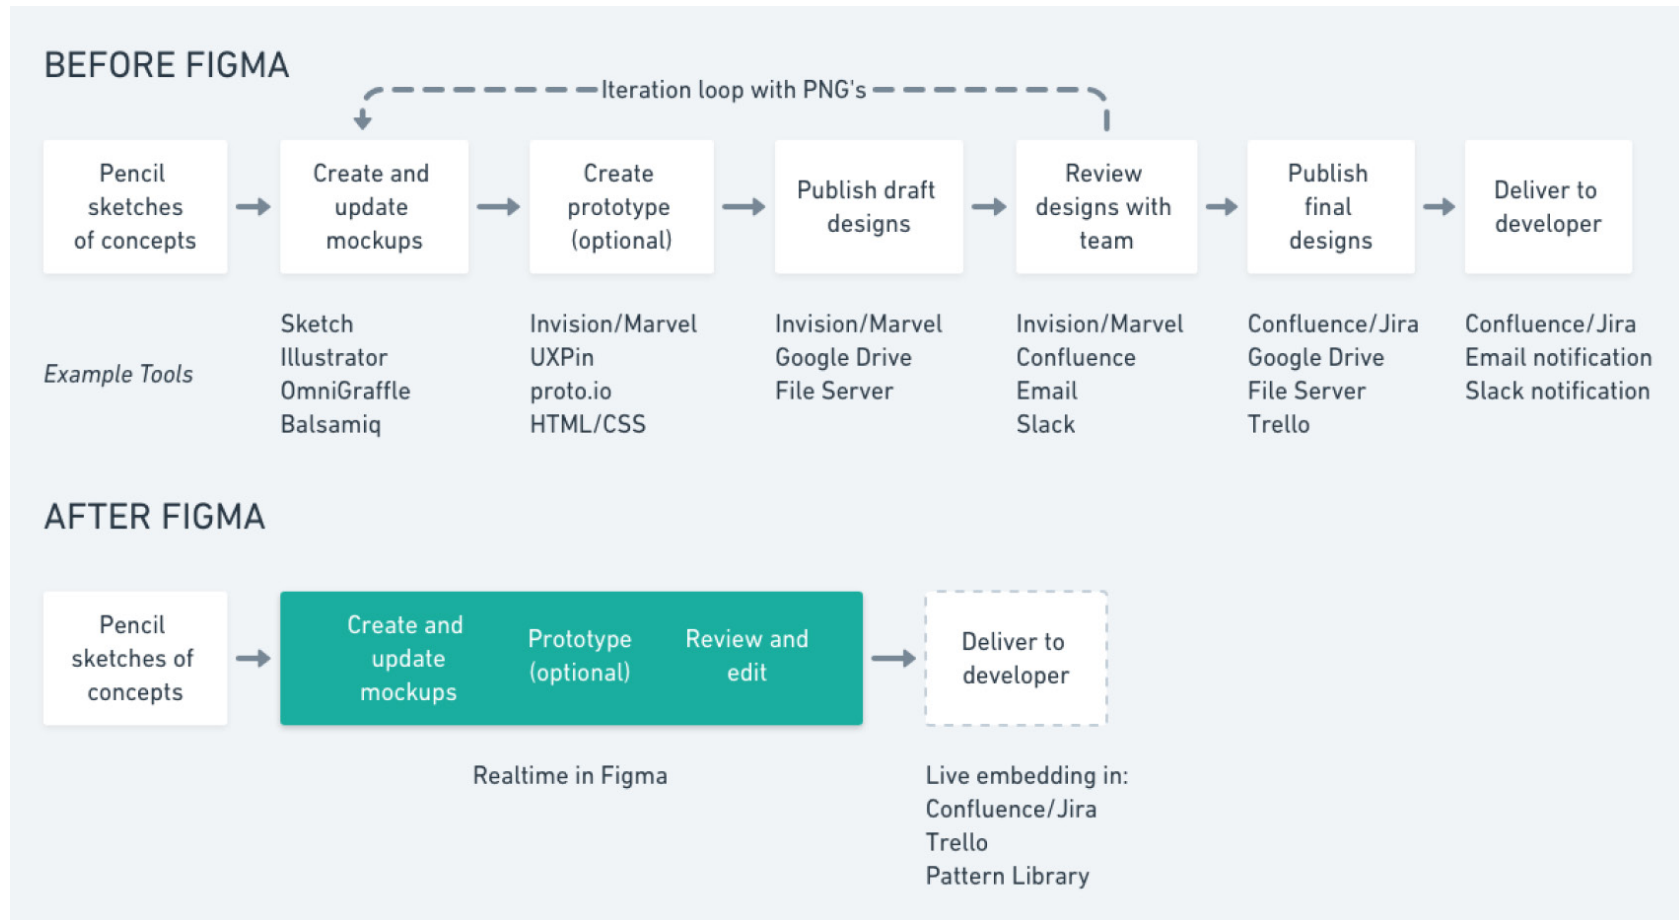

What you can do with Figma

- You can view the progress of my work in realtime
- Design components like buttons and text styles can be inspected by any developer
- You can download the design as jpeg, png, pdf
- You can give feedback by adding comments to my design

Feel free to ask any questions, I'm happy to guide you through the design process.

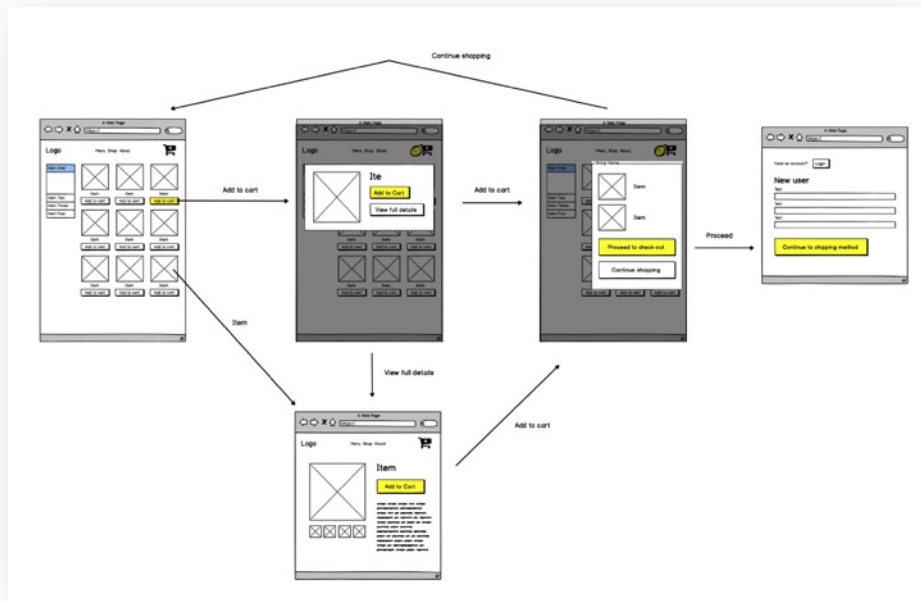

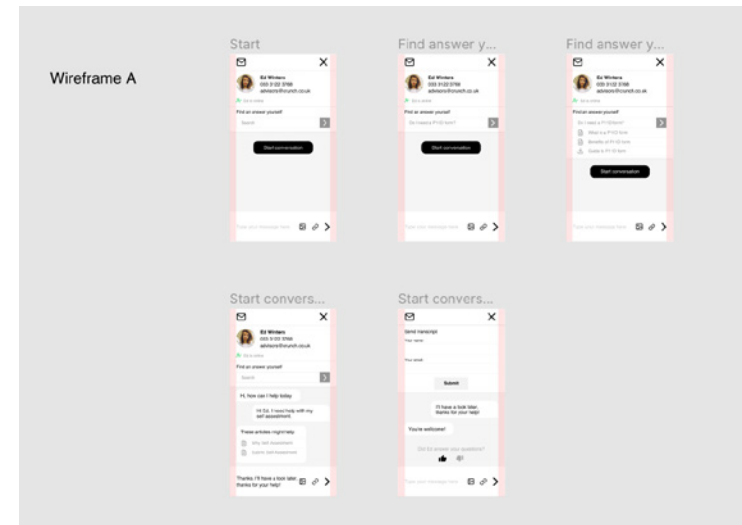

Overview of Figma

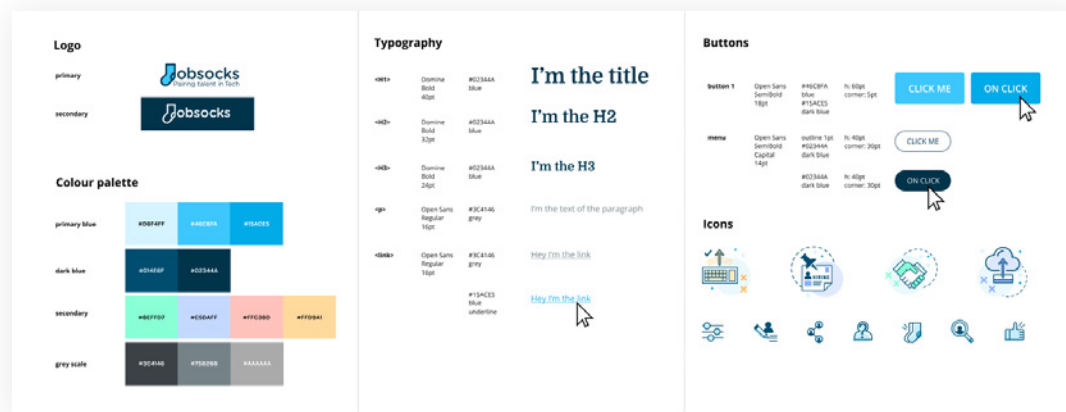

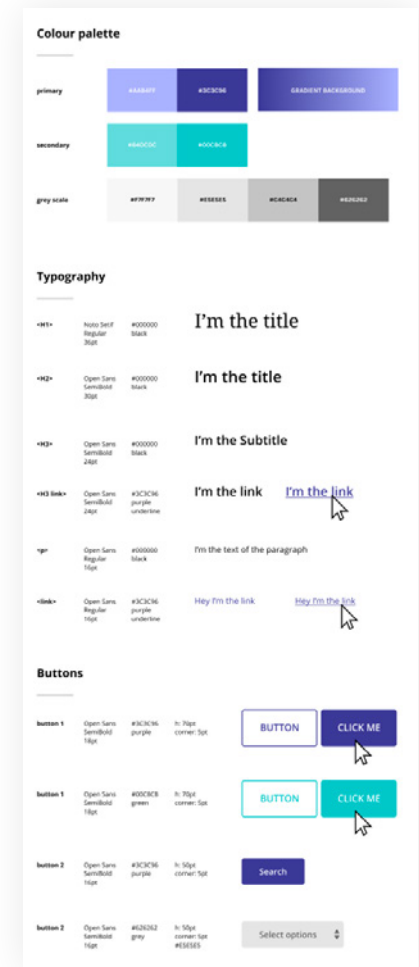

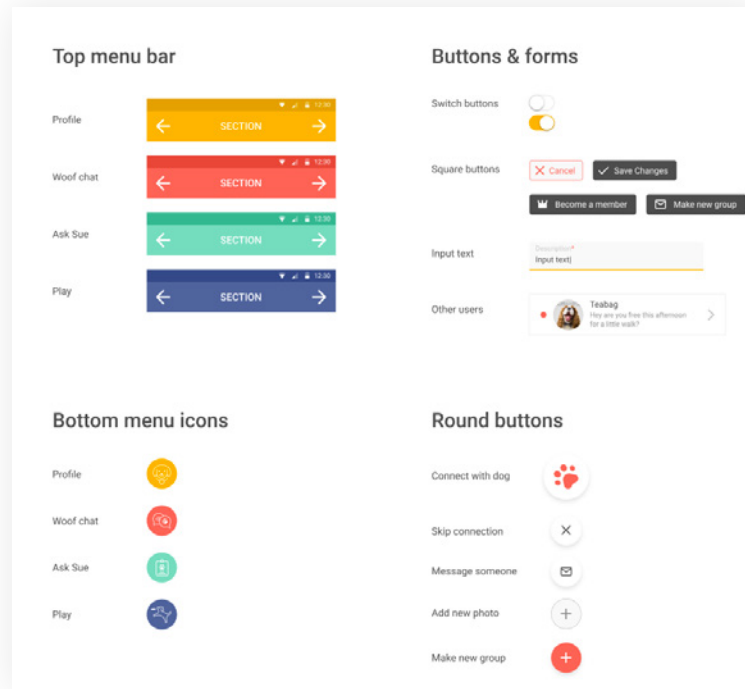

UX design

Before the look and feel, I will determine the layout and the functionality of your website. How it's organised and how all the parts relate to one another. If it works well and feels seamless, your users will have a great experience and come back again.

UI design

The user interface is the graphical layout of an application. All my websites have a solid and unique user interface that stands out from the competition. This includes screen layout, transitions, interface animations and every single interaction, including colours, fonts, buttons, forms, tags, icons, illustrations and any visual elements the website requires.

- Access to Figma boards
- Component library
- Web design on desktop, tablet & mobile
- jpeg, png, svg and eps files
